1. Luminous intensity is measured with a light sensor and filter combination that approximates the CIE eye-response curve.
2. $2_{1/2}$ is the off-axis angle at which the luminous intensity is half the axial luminous intensity
3. The dominant wavelength (λ_d) is derived from the CIE chromaticity diagram and represents the single wavelength which defines the color of the device.
4. Flux is measured with an accuracy of $\pm 15\%$.
5. Forward voltage is measured with an accuracy of $\pm 0.15V$.
6. CCT selection acc. to CCT groups and an accuracy of $\pm 300K$.
